

SMART INDIA HACKATHON 2026

TITLE PAGE

Problem Statement ID – SIH26206

**Problem Statement Title – AI-Based Urban Waterlogging
Risk Prediction and Preventive Response System**

Theme – Disaster Management

PS Category – Software

Team ID – 157783

Team Name – INNOVEX-1

THE PROBLEM

Reactive Waterlogging Response

Waterlogging is often addressed **after complaints or disruption**.

Rainfall, incident, GIS and drainage information are **fragmented**.

Limited municipal teams still need to decide **where to act first**.

Repeated failures may hide **upstream drainage causes**.

PROPOSED SOLUTION

Predict → Explain → Prioritize → Optimize → Simulate

CivicPulse combines rainfall, historical incidents, terrain, drainage, recurrence and exposure to predict **24/48/72-hour waterlogging risk**, explain why an area is at risk, estimate exposure, identify probable upstream causes, and generate a **preventive response plan**.

INNOVATION / UNIQUENESS

PRE-COMPLAINT FORECAST

Predict waterlogging risk before complaint volume rises.

DRAINAGE DEPENDENCY GRAPH

Trace risk through drain–road–waterbody relationships.

CREW & BUDGET OPTIMIZATION

Generate a feasible preventive work plan using available crews, time and budget.

END-TO-END DATA → AI → DECISION FLOW

DATA STORE • POSTGRESQL + POSTGIS • spatial layers, incidents, features, predictions, provenance & audit logs

FEEDBACK LOOP: FIELD OUTCOME → DATA QUALITY → MODEL RECALIBRATION

AI recommendation is decision support — not an automatic municipal order. Every recommendation must remain evidence-backed and field-verifiable.

FEASIBLE NOW**PROTOTYPE SCOPE**

- Chennai-focused MVP; one focused hazard: drainage-related waterlogging.
- 24/48/72h forecast horizons.
- Public/official rainfall + GIS + population/elevation data can seed the prototype.
- CSV/GeoJSON imports handle legacy or incomplete data.

KEY RISKS**Data & operational limits**

- True waterlogging/failure labels may be sparse.
- Drainage condition and ownership can be incomplete.
- Forecast uncertainty changes risk.
- Complaint reporting is not a neutral measure of risk.
- Stale/missing GIS can reduce confidence.

MITIGATION**CONTROLS**

- Baseline + ML comparison; time-based and spatial holdouts.
- Show confidence, evidence and data-quality warnings.
- Separate public / observed / simulation modes.
- Human verification before action; officer override.
- Recalculate as forecasts update.

36-HOUR MVP • RISK MAP • EXPLANATION • EXPOSURE • TOP-5 ACTIONS • CREW OPTIMIZER • WHAT-IF

No 100% accuracy claims. No guaranteed disaster-prevention claims. Data quality determines model reliability.

IMPACT AND BENEFITS

IMPACTS

MUNICIPAL OFFICERS

➤ Earlier risk watchlists and evidence-backed preventive decisions.

FIELD TEAMS

➤ Feasible inspection order based on crews, travel, urgency and budget.

CITIZENS

➤ Earlier preventive action can reduce potential disruption in exposed areas.

PLANNING & BUDGET

➤ Use risk, recurrence and exposure to target limited preventive resources.

BENEFITS

- 1 **EARLIER SIGNAL** — 24/48/72h risk horizons support pre-event inspection.
- 2 **EXPLAINABLE DECISION** — Shows contributing factors, **evidence** and confidence.
- 3 **EXPOSURE-AWARE** — Estimates **population** and **critical-facility** exposure.
- 4 **RESOURCE-AWARE** — Matches **priority** with **available crews, time** and budget.
- 5 **PREPAREDNESS** — **Compares rainfall** and **intervention scenarios** before acting.

PROPOSED PILOT KPIs

Lead time before event • Recall@top-10 risk cells • Risk reduction / budget unit • Exposure reduction • Travel distance saved
